2975

To eliminate the net we perform a triangle elimination in 237

This would create a lower face with vertices C, 6, 5, 0, and 1, i.e a pentagon, with two consecutive concave angles. If we can show that all the edges are shorter than 1 we are done

The diagram is

We apply the long edge lemma to

•) 1C face

Pin contribution below = 3

Pin contribution face above = 2

Triangle = 3

Total = 8 (recall the total must be ≤ 5)

•) 6C: if it is larger than π

the angle α at the ph would need to be larger than π

going back to the original net the quadrilateral 37P,6 would have one at least 3, so the face 2736501 must have one at least 4 violating Gauss Bonnet

- S6 Same count as 1C
- 50 Pin contribution below = 3
  Pin contribution above = 0
  Triangle = 3
  Total = 6 > 5

Finally 01 is the edge of a triangle
