Rete 2995

We can apply the same symmetry argument used to exclude the net 1508

We take the equator γ going through the midpoints of 24, 53, 08, 17 and 42

We let C be the point equidistant from the quadrilaterals 5038 and 7412 on the equator γ. Using the symmetry of the quadrilaterals wrt respect to C We conclude that 6=C and that the angle in 6 must be flat and cannot be $\frac{2\pi}{3}$ / $\frac{4\pi}{3}$.
