Net 1300

We wish to apply the "axis of pentagon" lemma to the pentagons 95'14'48 and '15'8410. We therefore need to show that the edges 95 and 01 are congruent and that the equator through the mid points is perpend. In fact we show the subnet: to know

Since '10''11', '12'13', '13'7, '11'6 are all congruent, the pentagons 9'10''11'65 and '12''13'732 are symmetric with respect to the equator
8 containing '11''13', which is orthogonal to 95, 32, and, 10 (and goes through the mid points of these)
