

All the faces are symmetric with respect to the equator γ going through 10 and 11. The symmetry with respect to γ maps γ_1 into γ_{12} and γ_3 into γ_{13}. So γ_1 and γ_{13} intersect transversally and

$$\gamma_{12} \cap \gamma_{13} = \{P_1, P_2\} = \text{vtx's}.$$

The symmetry then maps 14 into either P_1 or P_2. Since $14 \neq P_1$ and $14 \neq P_2$, this is, however, impossible.
