Explanation 2480

The diagram is

Note the 3, 4, 5, and 0 are on the same equator, which bisects all the angles of the convex faces which it crosses. In particular the triangles 645 and 457 are congruent. So 45 is long as the edge of a triangle. On the other hand OA and A3 are as long as the height H of a triangle. But $l + 2H = 2\pi$, so the edges 50 and 34 cannot have positive length.
