1325

The diagram is the following

The vertices 3, 0, 5 and 2 are on the same equator (*). The length of OC is that of the equal side of a triangle with angles $\frac{2\pi}{3}, \frac{\pi}{3}, \frac{\pi}{3}$.

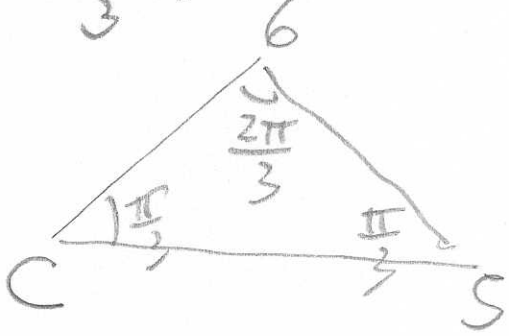

(*) C is the center of the triangle 041 and the intersection of γ with the equator

Continuing 16

So OC is the length of the edge of a square

The triangle C6S has also angles $\frac{\pi}{3}, \frac{\pi}{3}, \frac{2\pi}{3}$:

So CS is long as the edge of an equilateral triangle of angles $\frac{2\pi}{3}$

Thus $CS + CO = \pi$.

But the edges O3 and S2 have positive length. Contradiction.
