2616

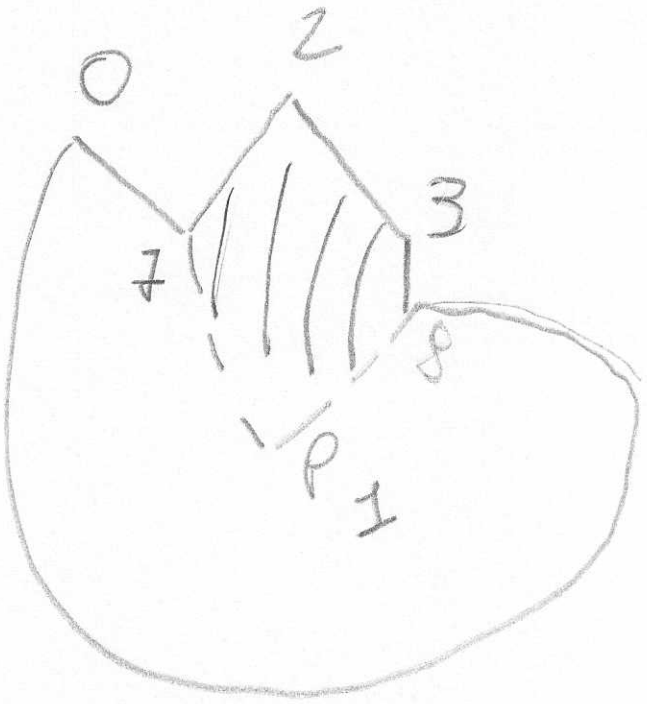

Consider the subset

We argue as for the set 1177 the points 0, 5, 4, and 8 are on the same equator. We remove the edge connecting 5 and 4 and bounding the non convex face containing the pin p_1.

We create a face

which is a $\{5,2\}$ pentagon which contains the shadowed area (which is at least $\frac{\pi}{3}$)

and the edge 80 which is longer than π. Arguing as for the not 177 we would conclude that the area of the $\{5,2\}$ pentagon is strictly larger than $\frac{5\pi}{4}$, which is a contradiction
